Reflection:

When we were deciding on colors for our website, we spent a lot of time looking at the visual identities already established across CU Boulder. We pulled inspiration from places like the ATLAS Institute, the BTU website, and other CU Boulder design systems because we wanted our site to feel connected to that larger brand image without copying it directly. Our font choices followed the same idea. By using Helvetica Neue in the right weights, we stayed consistent with CU's branding guidelines and kept the clean, modern look most CU websites rely on. It helped us build a foundation that felt familiar but still flexible enough for our own design decisions.

The color palette was one of the most fun and tricky parts of the process. We were really inspired by the BTU Lab logo, especially the way it uses primary colors to create a cohesive but energetic feel. We wanted something similar: colors that worked well together, supported accessibility, and gave us enough variety to use across different pages. To make sure our choices were actually accessible, we used color-blindness tools to test contrast and visibility. It was honestly surprising to see how different some colors looked depending on the type of visual impairment. Seeing those differences made us rethink certain combinations and helped us understand how important contrast really is for usability.

Looking ahead, we're thinking about evolving the site even more. One idea is to create our own hero sections that rely less on a big title font and more on layout, imagery, and color to guide the user. Before we move forward with that, we want to check in with the client to make sure our direction matches what he's envisioning. Overall, we're trying to balance our design identity with his needs so the final product feels intentional, accessible, and true to both sides.
